Re: Hillcrest Subdivision – Phase 7 (PR#36-2025)

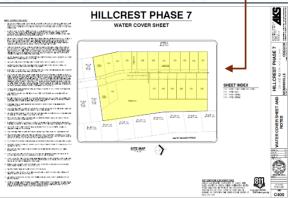

McMinnville Water & Light (PWS ID#00497)

Conditional Approval

Dear Ms. Gordon:

On March 4, 2025 our office received a completed land use compatibility statement (LUCS) and plans for the Hillcrest Subdivision – Phase 7 in McMinnville, Oregon (AKS Project: *Hillcrest PD – Holt 5147-02*). A check in the amount of \$3,300 for the plan review fee payment was received on March 5, 2025.

Included with the LUCS was a copy of McMinnville City Ordinance No. 5155 (passed December 18, 2024), which amended previous ordinances to allow the remaining phases of the Hillcrest Planned Development on approximately 106 acres (Tax Lot R4525 00801) for 392 additional residential lots in the general area between the westerly ends of SW 2nd Street and NW Horizon Drive and extending to the

northwest in McMinnville. Phase 7 is on the east end of the development and consists of roughly 600-LF of 8" dia. cement-mortar lined ductile iron water main to serve 19 lots (lots 115 – 133) along NW Valley's Edge Street.

The plans are approved with the following conditions needing to be met prior to Final Approval:

- 1. All items in contact with potable water must meet NSF Standard 61 or equivalent.
- 2. The design must allow for 20 psi to be maintained at all service meters.
- 3. Air-relief valves, if needed, must be installed at high points where air can accumulate. The breather tube on air-relief valves must be extended above ground surface and provided with a screened, downward facing elbow.
- 4. Water and sewer line crossings conform to OAR 333-061-0050(9) as noted in Water Construction Note #9 on Sheet C-400.
- 5. Disinfection of the waterline must be completed according to AWWA C651. Results from the coliform sampling must be provided to our office.

Until we receive verification that the conditions been met and Final Approval has been issued, the waterlines are not approved for use. Upon completion of the project, the engineer must verify in writing that construction was completed according to the submitted plans and conditions listed above.

Project Final Approval Request Form

To close out the project and request final approval from DWS, please fill out the Project Final Approval request form and email the completed form and a set of as-builts to me at evan.e.hofeld@oha.oregon.gov. Please be sure to reference Plan Review #36-2025.

If you have any questions, please feel free to email or call me at (971) 200-0288.

Sincerely,

on Afrika

Evan Hofeld, Regional Engineer OHA-Drinking Water Services

OAR 333-061-0050(9) Crossings – Sanitary Sewers and Water Lines

- Crossings-Sanitary sewers and water lines:
 - All reference to sewers in this section shall mean sanitary sewers;
 - In situations involving a water line parallel to a sewer main or sewer lateral, the separation between the two shall be as indicated in Figure 1;
 - In situations where a water line and a sewer main or sewer lateral cross, the separation between the two shall be as follows:
 - Wherever possible, the bottom of the water line shall be 1.5 feet or more above the top of the sewer line and one full length of the water line shall be centered at the crossing;
 - Where the water line crosses over the sewer line but with a clearance of less than 1.5 feet, the sewer line shall be exposed to the sewer line joints on both sides of the crossing to permit examination of the sewer pipe. If the sewer pipe is in good condition and there is no evidence of leakage from the sewer line, the 1.5-foot separation may be reduced. However, in this situation, the water supplier must center one length of the water line at the crossing and must prepare a written report of the findings and indicating the reasons for reducing the separation. If the water supplier determines that the conditions are not favorable or finds evidence of leakage from the sewer line, the sewer line shall be replaced with a full length of pipe centered at the crossing point, of PVC pressure pipe (ASTM D-2241, SDR 32.5), high-density PE pipe (Drisco pipe 1000), ductile-iron Class 50 (AWWA C-51), or other acceptable pipe; or the sewer shall be encased in a reinforced concrete jacket for a distance of 10 feet on both sides of the crossing.
 - Where the water line crosses under the sewer line, the water supplier shall expose the sewer line and examine it as indicated in paragraph (9)(c)(B) of this rule. If conditions are favorable and there is no evidence of leakage from the sewer line, the sewer line may be left in place, but special precautions must be taken to assure that the backfill material over the water line in the vicinity of the crossing is thoroughly tamped in order to prevent settlement which could result in the leakage of sewage. In this situation, the water supplier must center one length of the water line at the crossing and must prepare a written report recording the manner in which the sewer line was supported at the crossing and the material and methods used in backfilling and tamping to prevent settlement of the sewer. If the water supplier determines that conditions are not favorable
 - or finds evidence of leakage from the sewer line, the provisions of paragraph (9)(c)(B) of this rule apply.
 - When a water main is installed under a stream or other watercourse, a minimum cover of 30 inches shall be provided over the pipe. Where the watercourse is more than 15 feet wide, the pipe shall be of special construction with flexible watertight joints, valves shall be provided on both sides of the crossing so that the section can be isolated for testing or repair, and test cocks shall be provided at the valves.
